Summary

Full-stack software engineer building and shipping web software since 2020, with hands-on ownership of complex product development. Currently leading engineering for Koloseum, a multi-service esports platform built with TypeScript, SvelteKit, PostgreSQL, and Supabase.

Experienced across system architecture, domain and database modelling, authentication and authorisation, security, financial workflows, caching, automated testing, shared libraries, and containerised deployment. Particularly effective at translating operational requirements into maintainable systems and taking products from specification through implementation, testing, release, and iterative maintenance.

Skills

- **Languages:** TypeScript, JavaScript (ES6+), SQL, PL/pgSQL, HTML5, CSS3
- **Frontend:** Svelte, SvelteKit, Tailwind CSS, DaisyUI
- **Backend/Data:** Supabase, PostgreSQL, REST APIs, Supabase Edge Functions, Cloudflare Workers, Deno, database design, domain modelling
- **Security/Access Control:** Authentication, authorisation, role-based access control, PostgreSQL Row-Level Security (RLS), input validation, input sanitisation, sensitive-data workflows
- **Testing/Quality:** Vitest, Playwright, MSW, Supawright, unit testing, end-to-end testing, test fixtures/seeding, error handling, Sentry
- **Infrastructure:** Docker, Kubernetes, DigitalOcean, Cloudflare Pages (git-based continuous deployment), Valkey/Redis-compatible caching, containerised deployment

Experience

Ace Pro Sports Technologies

Head of Technology & Community Relations

October 2021 to present

Sports administration and technology firm in which I am also a director-shareholder. My work includes:

- Leading technology development and product engineering, translating operational and business requirements into software systems, and technical specifications
- Designing application architecture, service boundaries, data models, authentication flows, access control rules, and technical requirements for new platform functionality
- Working directly with business and community stakeholders to turn real operational requirements into implementable software
- Combining software engineering with domain expertise from sports competition operations, community management, and live event technology

Koloseum is an esports competition platform that is currently the principal product engineering initiative at Ace Pro. Its MVP iteration is centred on competitions, supported by infrastructure designed for players and gaming lounges. I lead the platform's engineering direction, including architecture, product specification, implementation, and iterative release.

- Building services across user domains (Public, Player, Lounge, Backroom) with TypeScript, SvelteKit, and Supabase, with shared logic published as installable packages
- Enforcing the platform's business rules in PostgreSQL rather than in each service, so that independently deployed applications cannot disagree
- Implementing authentication and authorisation with phone OTP, password login, TOTP, and role/feature-based access control
- Shipped Public Authentication service to production and operated it from March to October 2025. 64% of external (non-Koloseum staff) sign-ups completed an age-gated registration with identity verification; Player (individual) and Lounge (company) account paths were both exercised by real users. Though the application is currently not serving traffic, the production database and its user data remain under custody.
- Building financial logic, including Koloseum Credits ledgers, top-ups with database-enforced caps, payment methods, subscriptions, entitlements, and payment provider integration
- Adding Valkey caching (scoped to each service) to reads that dominate dashboards, with explicit TTLs and invalidation triggered by mutations as well as deliberate bypass on payment settlement, where a stale read would hide a completed top-up
- Building Snaplet-seeded Supabase environments and authenticated Playwright helpers so end-to-end tests can exercise role-based access, session lifecycle, finances, and other functionality as the roles that actually perform them
- Integrating third-party services through server-side and serverless (Edge Function) logic
- Containerising services and maintaining Kubernetes deployment configuration, health checks, and shared conventions

Freelance software developer

Full-Stack Engineer

January 2021 to present

Independent software developer delivering and maintaining web systems for clients.

- **Arkad World Ltd** (<https://arkadworld.com>) - Kenyan conference interpreting, translation, and conference management company. Migrated their marketing site from WordPress to Jekyll and continued maintenance. The contact form is not wired to a custom backend; it uses Formspree and reCAPTCHA.

TEKKEN 254

Founder / Community Organiser / Web Developer

August 2017 to October 2021

A venture I founded that seeks to grow the Tekken community and establish a competitive Tekken scene in Kenya.

- Built and shipped the organisation's website with Jekyll, Bootstrap, Sass, and Liquid
- Played a major role in organising 15 tournaments across three full seasons of the TEKKEN 254 Circuit (now the Savanna Circuit) and 30+ editions of Savanna Fight Night
- Built relationships with competitors, organisers, sponsors, and international esports stakeholders; created sponsorship and international competition opportunities for Kenyan players
- Developed first-hand expertise in competition administration that was later incorporated into Koloseum

Education

- **Full-Stack Engineer Career Path** - Codecademy, issued May 2023
- **CS50: Introduction to Computer Science** - Harvard University, 2023
- **BTEC Level 3 Extended Diploma in Sport** - Hadlow College, 2015–2017

Additional domain expertise

Gaming and esports: Competition platforms, tournament administration, gaming lounge operations, player management, competition data, grassroots esports; this helped shape Koloseum's product and data model.
